

HAVE YOU CONSIDERED PRESERVING DNA?

IMPORTANT: DNA preservation is not possible after cremation or embalming. Please read and understand this service before making a decision.

SecuriGene DNA Capsule

DNA encodes information about every individual, ranging from hair color, eye color and other physical traits, to inherited health risks, family medical conditions and ancestral origins. When a person passes away, this information is often lost forever - making DNA preservation a vital end-of-life consideration. This information can also be valuable for future healthcare purposes, as medical professionals are increasingly relying on genetic testing to determine different cancer types, optimal drug dosage levels, and heritable disease risks to help other members of the family.

If you choose to proceed with this service, notify your funeral service provider immediately. A DNA sample will be sent to SecuriGene for processing. The laboratory will extract, purify and preserve the DNA, then seal the sample and return it to you for safekeeping along with full reports certifying the quantity and purity of the banked DNA.

Would you like to preserve a DNA sample?

- Yes** - I would like to proceed with DNA preservation (*see reverse*)
- Still Deciding** - I would like to learn more about DNA preservation before making a decision, but authorize my funeral provider to collect a DNA sample before cremation or embalming
- No** - I have read the above and understand that DNA will be permanently destroyed after cremation or embalming and choose to decline this service

PLEASE SEE BACK OF SHEET FOR MORE INFORMATION AND COMPLETE LIST OF TESTS
